Process Example: Regression with Interaction

The response is the yield (Y) of a certain process, the predictors are temperature and concentration. We consider models with and without interaction between temp and conc. In this example, we treat both temp and conc as continuous, but in practice, with just two levels for each predictor, I would probably run this as a 2way ANOVA (treating temp and conc as categorical).

In this example we look at several models:

- 1. Model1: Simple linear regression using just Temp.
- 2. Model2: Simple linear regression using just Conc.
- 3. Model3: Multiple regression with both Temp and Conc (but no interaction).
- 4. Model4: Multiple regression including Temp, Conc and Temp:Conc interaction. "By hand" for illustration.
- 5. Model5: Multiple regression including Temp, Conc and Temp:Conc interaction. Same as Model4.

```
library(ggplot2)
library(dplyr)
library(effects)
library(gridExtra)
Process - read.csv("~/Dropbox/STAT512/Lectures/MultReg2/MR2_Process.csv")
Process
```

```
yield conc temp

Scatterplot with color coded observations

or griof object

Here we use the qplot() function from ggplot2. ggplot2 allows us to build plots in "layers".

p <- qplot(temp, yield, shape = factor(conc), color = factor(conc), data = Process)</pre>

Simple and Multiple Regressions

We start by looking at the simple means for each treatment combination and the pairwise correlations. Then fit some models.

Adding Interaction term "By Hand" (for illustration)

We use the mutate() function from dplyr to calculate a new variable tc (=temp*conc) and add this term to the model.

```
crute colum
Process <- mutate(Process, tc = temp*conc)
str(Process)
## 'data.frame':
                 8 obs. of 4 variables:
## $ yield: int 62 64 74 72 65 66 81 84
## $ conc : int 1 1 2 2 1 1 2 2
## $ temp : int 130 130 130 150 150 150 150
               130 130 260 260 150 150 300 300
         : int
Model4 <- lm(yield ~ temp + conc + tc, data = Process)
summary(Model4)
##
##

Adding Interaction term (Standard Approach)

In practice, we do not need to create the interaction term in advance. Note that the predicted values exactly equal the means, because we have a saturated model.

```

Diagnostic Plots

Resids vs Fitted values for models with and without interaction. Note that I could also have used the plot() command directly (ex: plot(Model3)).

```
par(mfrow = c(1, 2))
plot(Model3$residuals ~ Model3$fitted.values)
abline(h = 0)
title("Model3: No Interaction")
plot(Model5$residuals ~ Model5$fitted.values)
abline(h = 0)
title("Model5: With Interaction")
```

Visualizing the fitted models

Note in Approach#2, that I use yet another approach for adding a column to a data frame.

temp*conc effect plot
